Commercial Furniture Dealer **Tsunami Axis** invited **JST** to design and install an adjustable pallet system for their new warehouse facility in St Neots, Cambridgeshire. This including decking and safety barriers and a suitable lift truck in order to accommodate **Tsunami Axis** continued rapid expansion within the UK.

JST team worked closely with **Tsunami Axis’s** project team from an early stage to design a warehouse area and storage system that provide various levels. The solution was d the complete flexibility for order picking many different products at a narrow aisle pallet racking system achieving a pallet capacity of over 4000 locations. The racking bays are 2700mm wide and store two pallets at every beam level, in the bottom bays pallets are stored on the floor and are accessible for picking as necessary. Each beam level boarded to create the required pick locations within the bay and the system was configured to suit the operation an articulated narrow aisle lift truck. End of aisle tubular protection barriers along with upright frame protection were also supplied and installed by JST to complete the project.

JST also supplied and installed a brand new Flexi articulated narrow aisle fork lift truck on a contract hire agreement which included full maintenance and servicing.

“JST completed the entire project within our budget and timescales stipulated. I would highly recommend their services. Simon O’ Connor, Tsunami Axis
